ST. JOSEPH, MO.

# Atlas Sorgo-

is a cross between Blackhull Kaffir and Sourless Cane.

Like most hybrids, it combines in one variety not only the characteristics of the two parents, but develops other improved traits.

This outstanding trait in Atlas Sorgo is its tremendous yield, both in forage tonnage and grain.

It grows from 7 to 10 feet, and requires 120 to 130 days to mature.

The variety has a sturdy, leafy stalk, abundantly juicy and sweet.

The heads are fairly compact, somewhat cylindrical in shape.

Atlas Sorgo is superior to Kansas Orange in resistance to lodging and in having white palatable grain.

Feeding trials indicate that Atlas grain is equal to Kaffir and that the forage is fully as good as Kansas Orange Cane or Sumac.

Atlas Sorgo, being a variety of sorghum, should not be planted until the ground is

thoroughly warm, and not covered too deeply.

It does best if sown reasonably early on well prepared fertile soil.

The usual quantity sown per acre is 5 to 10 pounds.

The experience below is typical of many others who have planted Atlas Sorgo:

To Mitchelhill Seed Co.  
St. Joseph, Mo.

Gentlemen:

This past year, we planted 30 acres of Atlas Sorgo and notwithstanding the drought, this acreage yielded 675 tons of forage and a little more than 1,500 bushels of grain.
